TI - LOCAL AREA NETWORK
 AB - PURPOSE: To use a network at an optional location by reading a physical address recorded on an ID card carried by a person at the network and setting the physical address on a LAN.
 - CONSTITUTION: A card information read section 1 reads information on an ID card in an ID card reader and converts the information on the ID card into a code suitable for the system. An address storage section 2 stores a physical address required for the network in the read information. In this case, when the ID card recognizes the connection to the ID card reader, an ID card control section 3 reads the ID card information in the card information read section 1 to input the information of the ID card and informs a network address to the address storage section 2. Moreover, when a request of address reference takes place from the protocol of the network system, the address storage section 2 references the physical address and informs the physical address to the protocol.
